

Biosafe filter systems for all pond and aquarium filters

description

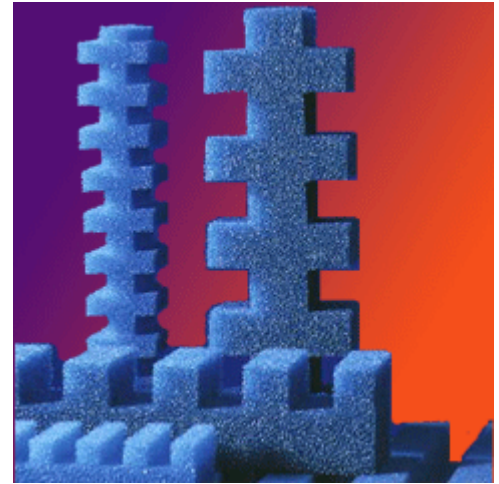

BioSafe – the novel filter material for all pond and aquarium filters. The patented arrangement of ridges on the filter matting provides a much larger surface area for removing dirt and pollutants from water.

Due to the enormous inner surface, a much larger number of bacteria for degrading water impurities can be trapped in comparison to other filter materials.

On basis of cut-in water ducts - in single or double T-shape - the water is allowed to flow more freely resp. more smoothly, thereby preventing a shortage of oxygen inside the filter and thus the growth of putrefactive bacteria.

characteristics

- **BioSafe** ensures gentle mechanical and biological cleaning of water
- **BioSafe** has a much larger outside and inside surface area in comparison to other filter materials
- more rapid and superior growth of aerobic bacterial cultures
- **BioSafe** reduces the cleaning frequency for both, pond and aquarium filters
- even in case pores of the front filter matting get blocked, a reasonable water flow rate is ensured
- easy handling as no water ducts have to be provided
- you save time, money and trouble
- you can clean your filter whenever you have time - i.e. during winter month

standards

Our **BioSafe** filter material is available in sheets, cuttings, punched parts or preforms in various dimensions and porosities (PPI 10 – 45), both as a mini profile for the aquarium sector and in standard sizes for the garden pond sector.
